11. Deploying Zoho Creator App to Production

Aim:

To understand and execute the deployment lifecycle of the **Patient Appointment Booking** application in Zoho Creator, moving components from the sandboxed Development Environment to the Live Production Environment safely and efficiently.

Overview:

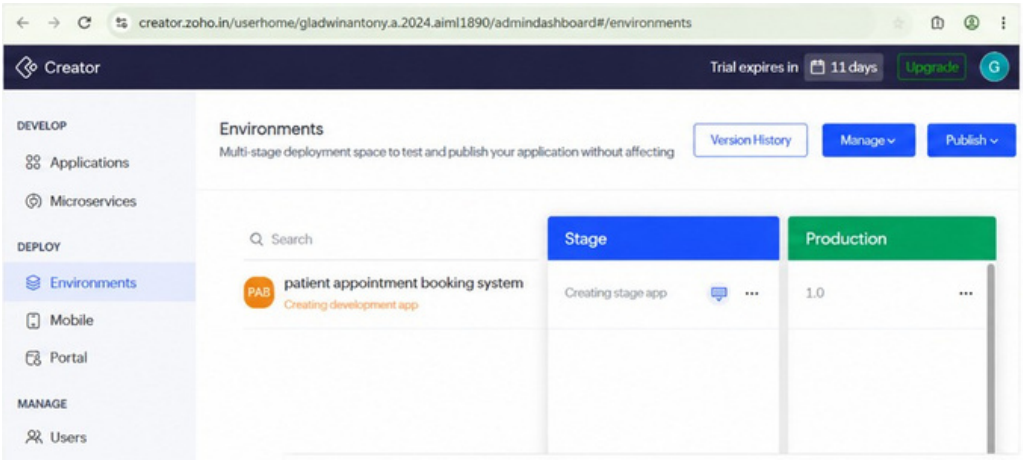

Zoho Creator provides distinct environments to separate application building and testing from live user operations. Proper deployment ensures medical data integrity, patient booking continuity, and seamless release management.

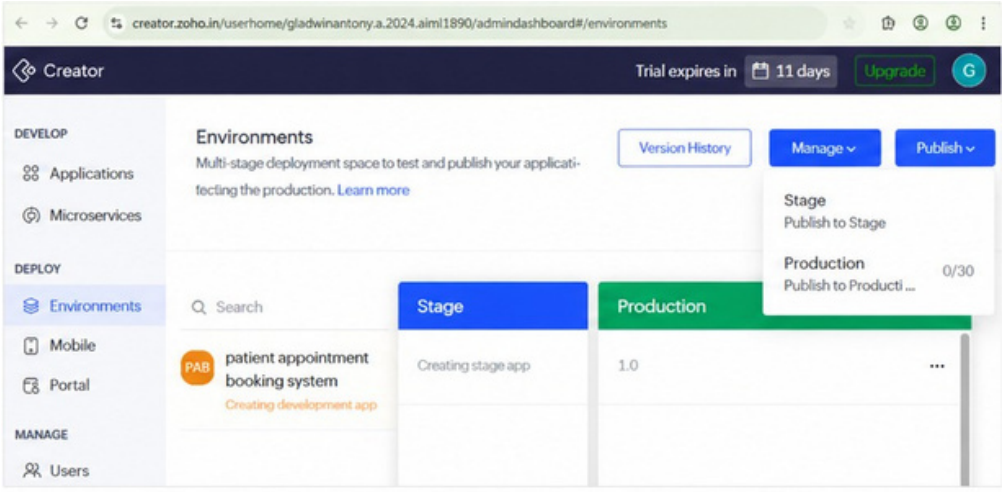

Environment	Purpose & Operational Rules
Development (Sandbox)	Used for building appointment forms, writing Deluge scripts, and testing doctor scheduling features without impacting live patient data.
Production (Live)	The live environment accessed by end-users (receptionists, doctors, patients), containing active transactional appointment records and strict access controls.
Migration & Publish	The controlled process of pushing appointment form schemas, notification workflows, and integration configurations from Dev to Prod.

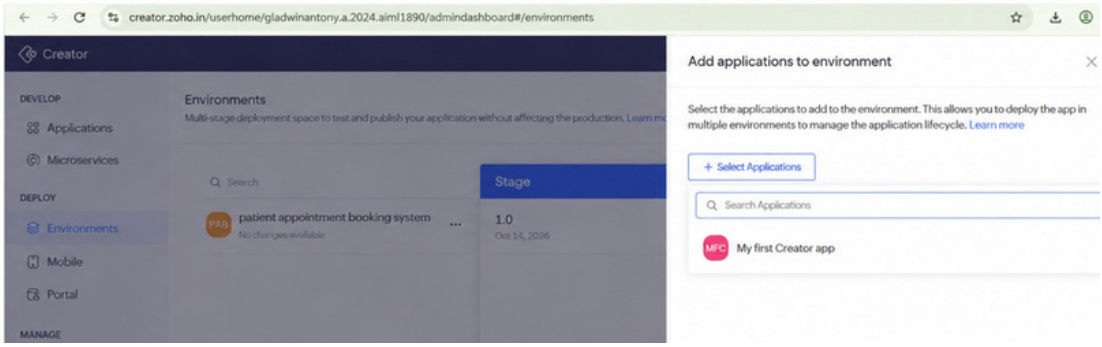

Procedure:

1. **Pre-Deployment Validation:** Open your fully tested *Patient Appointment Booking* application in the Zoho Creator development workspace. Verify that all Deluge scripts, doctor slot assignment triggers, and appointment confirmation reports are fully functional.
2. **Initiating Migration:** Navigate to the deployment manager or settings menu and select the option to push or migrate changes to the production environment.
3. **Reviewing Schema & Component Diffs:** Inspect the comparison report generated by Zoho Creator, which highlights newly added appointment forms, modified patient fields, or updated Deluge script blocks.

Screenshots:

Result:

The deployment lab successfully demonstrated the transition lifecycle of the low-code **Patient Appointment Booking** application from development to production in Zoho Creator, emphasizing safe release management and environment isolation.
